753	**Enable GRUB password**
	
	Set a password in the GRUB configuration file. This is often located in one of several locations, but can really be anywhere:
	
	`/etc/grub.conf /boot/grub/grub.conf /boot/grub/grub.cfg /boot/grub/menu.lst`
	
	For all files mentioned above ensure that a password is set or that the files do not exist.
	
	To set a plain-text password, edit your GRUB configuration file and add the following line before the first uncommented line:
	
	`password <password>`
	
	To set an encrypted password, run grub-md5-crypt and use its output when adding the following line before the first uncommented line:
	
	`password --md5 <encryptedpassword>`
	
	For either approach, choose an appropriately strong password.

	`sysctl -w net.ipv4.conf.all.secure_redirects=0`

736	**Reset umask value** To ensure complete access control over newly created files, set the umask value to 077 for root and other user accounts for both interactive and non-interactive processes. The umask value for interactive processes is typically set via PAM. See 'man 8 pam_umask'. For non-interactive processes, /etc/login.defs is a common location for controlling umask on Linux systems. In both cases, you may need to consult your operating system's documentation for the correct file(s) and settings. For Red Hat Enterprise Linux and derivative distributions the umask value is set in /etc/profile and /etc/bashrc shell configuration files. See the Red Hat manual for more details. 	`sysctl -w net.ipv4.tcp_timestamps=0`
	
	Additionally, put the following value in the default sysctl configuration file, generally sysctl.conf:
	
	`net.ipv4.tcp_timestamps=0`
		TCP timestamp response

0	**Disable ICMP timestamp responses on Linux**
	
	Linux offers neither a sysctl nor a /proc/sys/net/ipv4 interface to disable ICMP timestamp responses. Therefore, you should block ICMP on the affected host using iptables, and/or block it at the firewall. For example:
	
	`ipchains -A input -p icmp --icmp-type timestamp-request -j DROP`
	
	`ipchains -A output -p icmp --icmp-type timestamp-reply -j DROP`
	
	The easiest and most effective solution is to configure your firewall to block incoming and outgoing ICMP packets with ICMP types 13 (timestamp request) and 14 (timestamp response).
